

External Content - DNAApp

Overview:

The External Content application is used to create and maintain links that are displayed in a web browser within DNA™.

Key Benefits:

This application gives the financial institution the ability to create links to any internal or external web site for display in a web browser within DNA.

Processing:

This application contains an administration screen that is used to create, edit, and delete links, and a display screen that lists and shows currently active links.

When the external content maintenance screen is opened a list of all external content is displayed and is available to add to, edit, and delete.

When the external content display screen is opened all active external content records are listed on the left side of the screen. The first record in the list is selected and displayed by default.

The screenshot displays the 'External Content' application interface. At the top, there is a navigation bar with 'External Content' and a dropdown arrow. Below this is the 'Display External Content' section, which includes a search bar and buttons for 'Refresh List', 'Back', and 'Forward'. The main content area is divided into two columns. The left column contains a list of links, with 'Link' selected. The right column displays the details for the selected link, 'All Notes Screen'. This details view includes a title, author (Greylock Technology Group), reviews (0 reviews), a description, and a 'Get Details' button.
